

# EVERCURE™

## WHAT IS EVERCURE?

*One of the greatest assets of Everlast, and what sets us apart is the Evercure® Process. This process includes the revolutionary CECI® enhancement that not only seals the metal's cut edge, but also protects it from both natural and commercial corrosive elements. Everlast's panels are stronger, more durable and less likely to crack over time. The Evercure® Process is state-of-the-art and we are confident it will continue to set the standard for quality metal building components.*

## HEAT FORMING™

**Why does Everlast Heat Form?** Cracks allow moisture, which is often contaminated by atmospheric pollutants, to penetrate the protective surface of the coating, and cause the substrate to rust and corrode. In fact, the fracture in the paint can cause a painted panel to corrode at a faster rate than an unpainted panel. At the point where the paint film has been exposed electrochemical cells are established which will promote greater and faster corrosive attack. The result is accelerated corrosion at these areas because of their tendency to remain wet longer.

The Heat Formed™ panel creates a more flexible paint system which is better able to withstand the rigors of the forming process. The paint coverage is not compromised and the result is an outstanding barrier protection. This barrier protection prevents corrosion by isolating the steel from the environment.

## ADVANCED TOOLING

**Advanced State-of-the-Art Tooling is another area of excellence in Everlast Roofing's roll formed products.** Using additional stands places less stress on the formed radius of our panel providing for the most consistent panel profile on the market.

## CECI®

At Everlast, we have been working on a way to protect the cut edge of our manufactured steel panels. After committing to buying only the best steel on the market, and innovating the traditional roll forming process with Heat Forming™, we went even further with the last step in our Evercure™ process. This application is being applied to a factory cut edge of all Everlast II™, PBR™, and "A" Panels. **Because the corrosion inhibitor applied is a clear product, end-users will see virtually no sign of CECI®.** It works to protect against and effectively decrease corrosion rates, as proven through industry research. Our goal at Everlast Roofing, Inc. is to incorporate cut-edge technological advances to our products to ensure the highest standard of quality. **CECI® is just another step in our commitment of bringing to the metal marketplace, only the finest materials in quality building components.**

## FINISHED PANEL

*As proven through industry research, Everlast's panels are stronger, more durable and less likely to crack over a duration of time.*

# A SYMBOL OF QUALITY AND INNOVATION IN METAL ROOFING AND SIDING...

We have mastered the process of Heat Forming™ Panels. Our panels are stronger, more durable and less likely to crack over a duration of time. We have recently introduced our CECI® enhancement that not only seals our cut edge, but also protects it from natural and commercial corrosive elements. We are proud of our Evercure™ process and trust it will continue to lead the industry in producing quality metal building supplies.

The image is a comparison of three types of metal roofing panels. It features three distinct sections separated by green geometric lines. The top-left section shows a close-up of a 'Major Rib' on a roof, with a light green overlay. The top-right section shows a close-up of a 'Everlast Panel' with a dark, textured surface. The bottom-left section shows a close-up of a 'Competitor's Panel' with a dark surface and visible vertical cracks. The bottom-right section shows a close-up of a 'Typical Roll Formed' panel with a red overlay. The word 'VS.' is centered between the sections.

**COMPETITOR'S PANEL**

**TYPICAL ROLL FORMED  
AT 80° MAJOR RIB**

The photos above show how Everlast's Heat Forming™ panel outlasts the competitor's panel. The Heat Formed™ panel creates a paint system that is more flexible and therefore better able to withstand the rigors of the forming process. The paint coverage is not compromised and the result is outstanding barrier protection. This barrier protection prevents corrosion by isolating the steel from the environment.
